

Sidequest

your weekend, verified

Hackathon Video Pitch Script (v1)

Format: Optional 10 sec on camera → screen recording with voiceover. No slides.

Target length: ~2:50–3:00

ACT 1 — The problem (0:00 – 0:40)

You, casual — walking in London or at your laptop

"I'm in London right now. I go to hackathons all the time — I sign up on Luma, I commit to the build, I'm in the zone Saturday... and then there's the rest of the weekend."

"The problem isn't that there's nothing to do. There's too much. Hackathons, meetups, pop-ups, dinner with friends, a swim at Hampstead Heath if the weather's right — but I don't have the time to scroll through a hundred listings and figure out: Can I actually make this? Can I afford it? Do I even want it? And if a mate's free — does anything work for both of us?"

"I kept closing tabs and still not knowing what my weekend was. That's the thing I wanted to fix."

ACT 2 — What I built (0:40 – 1:00)

Cut to Sidequest

"So I built Sidequest — your weekend, verified."

"You set your constraints — budget, diet, what you're in the mood for. It reads your calendar so it knows when you're free. It searches the live web for real events, runs them through a deterministic filter so junk never reaches the AI, and gives you a plan with citations — not vibes."

ACT 3 — Demo: Discover (1:00 – 1:55)

[Sign in → profile: London, budget, preferences]

[Map loads — events pin across the city]

[Tap a card — badges: Budget, Diet, free Saturday afternoon]

"I'm in London. Say I want something under fifty quid, I'm vegan, and I'm into live music and getting outside."

"Sidequest hits the open web with Tavily — actual listings, this week. Then Prometheus applies Vatalog rules: budget, location, diet, my free slots from Google Calendar. Twelve in, four out — only what passed shows up here."

"Every badge is a rule that passed. I'm not trusting an LLM to guess whether Hampstead Heath or a rooftop gig fits my life — the logic already decided."

ACT 4 — Demo: Plan (1:55 – 2:40)

[Select event → Plan this weekend]

[Results panel — itinerary + filter stats]

[Open cited.md]

"This one's interesting. I plan the full weekend around it — events, food, the lot. Same pipeline: search, verify, then Gemini formats an itinerary from verified rows only. No invented restaurants."

"Saturday afternoon, Sunday morning — real venues, real links, real prices."

"And the agent publishes to cited.md — filter stats, every verified candidate, the full itinerary, sources. If a judge — or future me — asks 'why this plan?', the answer is in the file."

ACT 5 — Close (2:40 – 3:00)

[End card: Sidequest logo + GitHub + 'your weekend, verified']

"Sometimes I want a hackathon. Sometimes drinks with friends. Sometimes a swim. Sidequest doesn't pick for me — it cuts the scroll, applies my constraints, and only shows what's real."

"Your main quest might be the build. Sidequest is everything else — verified."

"GitHub in the description. Go plan your weekend."

Shot list

Time	Visual
0:00	You talking OR phone scrolling aimlessly (B-roll)
0:40	Sidequest sign-in screen
1:00	Onboarding form fill
1:10	Map + event cards + filter stats
1:30	Event card badges close-up
1:55	Plan button → loading → results panel
2:15	cited.md scroll
2:35	Langfuse trace (optional, 3 sec)
2:50	End card

One-liner

"I built Sidequest because London weekends are full of options — and I was spending more time scrolling than actually living them."

Hackathon checklist

- Autonomous agent on open web (Tavily)
- Prometheus deterministic filter
- cited.md mandatory output
- Live functional demo
- Sponsor tools: Tavily, Prometheus, Gemini, Langfuse, Firebase
